General handling information for the integrated drive

When installing or removing the integrated drive, extreme care must be taken to avoid damage to the body of the integrated drive. Although the integrated drive looks very rugged from the outside, it must be remembered that, due to the brazing process used to join ceramic and copper, the copper is in a soft, annealed condition and is therefore highly avoided. Use existing threads and holes for fixation. For all integrated drives, we recommend that one side be mounted non-rigid to prevent excessive thermomechanical and external forces from acting on the capacitor.
